

SITE STATUS SUMMARY OF CONDITIONS

WATER CLARITY

TOTAL PHOSPHORUS

CHLOROPHYLL A

DISSOLVED OXYGEN

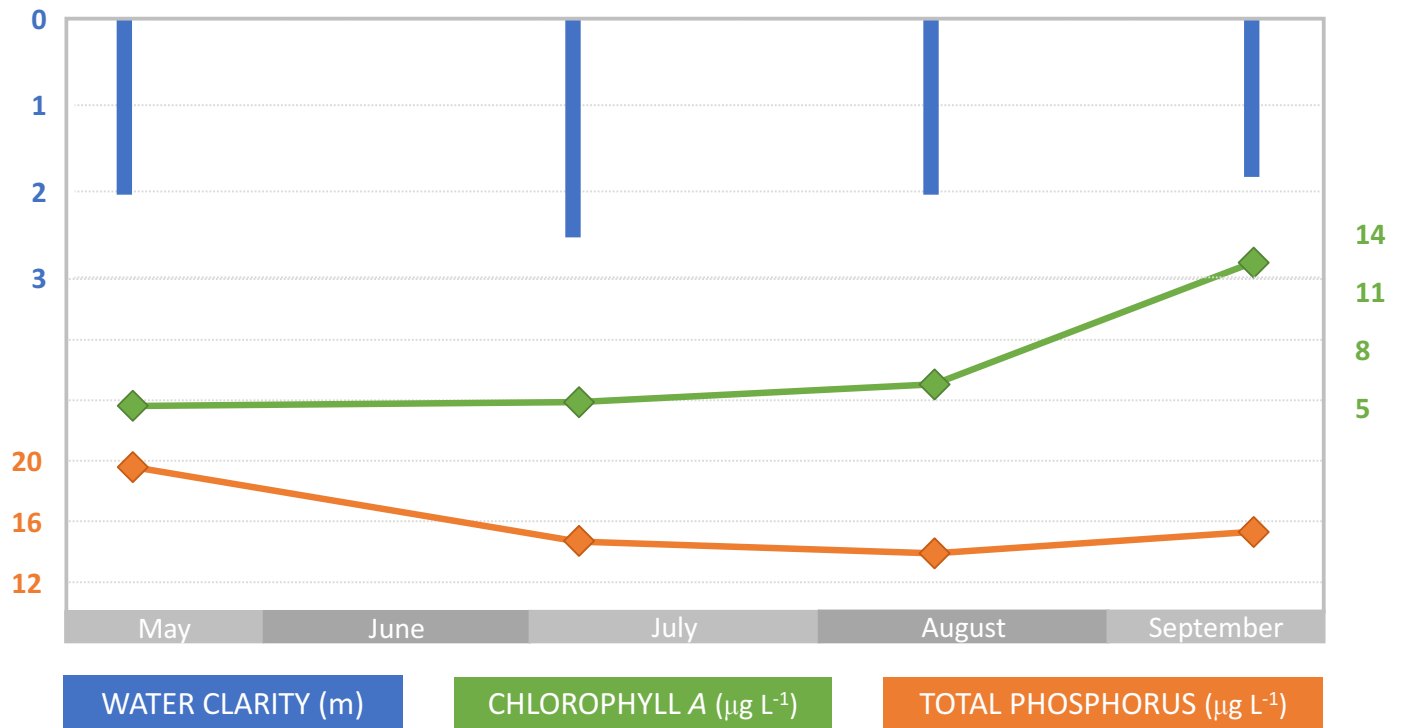

TROPHIC STATE

EUTROPHIC

At site 1 Deep, water quality is generally poor. "While standard oxygen tests were not conducted due to the lack of the formation of distinct deep layer, oxygen profiles measurements revealed low oxygen at the lake bottom in July and August." changes fast – indicates problems

TREND degrading improving flat too few data CURRENT poor good excellent no data

SITE RESULTS SEASONAL WATER QUALITY PATTERNS

LAKE BASICS BACKGROUND INFO

Site Depth	1 Deep – 17 feet
Lake Max/Mean Depth	17 feet / 7.9 feet
Location	Wakefield, NH (Carroll Co.)
Watershed Area	5.9 square miles
Lake Area	190 acres
Shore Length	7.4 miles
Lake Volume	not available
Flushing Rate	5.4 times per year
Lake Elevation	564 feet

LOW DISSOLVED OXYGEN at 1 Deep indicates susceptibility to internal phosphorus loading, which could increase the amount of phosphorus available to stimulate plant and algal growth.

INVASIVES are present (water variable milfoil) and is currently being treated.

WATERSHED RESTORATION EFFORTS by the Acton Wakefield Watersheds Alliance began in 2008 to help improve water quality. Work will be ongoing to achieve water quality goals.

WATER QUALITY REVIEW

LEARN MORE ABOUT LAKE HEALTH

LAKE PRODUCTIVITY is determined by multiple factors, including

WATER CLARITY Water clarity is used as an indirect measure of algal productivity, but is also influenced by suspended sediments and dissolved color.

CHLOROPHYLL A A green pigment found in plants and algae, it is used to estimate algal biomass. Algal growth is promoted by phosphorus, increasing chlorophyll.

PHOSPHORUS A key nutrient that stimulates algal blooms and excessive plant growth, particularly for invasive species.

DISSOLVED OXYGEN Low dissolved oxygen can kill or stress organisms and release phosphorus from sediments, further degrading water quality.

LAKE TROPHIC STATE is generally broken into three categories

OLIGOTROPHIC

DEEP

LOW

LOW

HIGH THROUGHOUT
WATER COLUMN

MINIMAL PLANTS

MESOTROPHIC

REDUCED

MODERATE

MODERATE

OCCASIONALLY LOW
IN BOTTOM WATERS

FREQUENTLY LOW IN
BOTTOM WATERS

ABUNDANT PLANTS

LAKE AGING is both natural and accelerated by human activities

Lakes **NATURALLY** age or become more productive over thousands of years. In recent geologic time, humans have enhanced the rate of nutrient enrichment and lake productivity, speeding up this natural process to tens or hundreds of years.

HUMANS introduce excess phosphorus enters the lake in eroding sediment, groundwater (e.g. aging septic systems), or stormwater runoff, which contains fertilizers, detergents, or other phosphorus-based products. Algal blooms and uncontrolled sediment erosion along the shoreline can decrease water clarity, which can reduce shoreline property values.
